

CLAIMS

I claim:

1. A device for dispensing sandwiches comprising:

a tubular body having an oval cross-section, said tubular body having a slot extending longitudinally along and through a wall of said tubular body; and

a disk member positioned interior of said tubular body, said disk member having an arm extending outwardly therefrom, said arm extending outwardly of said tubular body through said slot.

2. The device of Claim 1, said wall of said tubular body being flexible.

3. The device of Claim 1, said tubular body having a closed end and an open end, said disk member positioned adjacent said closed end.

4. The device of Claim 1, said disk member being a solid planar member extending transverse to a longitudinal axis of said tubular body.

5. The device of Claim 1, said slot comprising:

a first slot extending along and through said wall of said tubular body; and

a second slot extending along and through said wall of said tubular body on an opposite side of said tubular body from said first slot.

6. The device of Claim 5, said arm comprising:

a first arm extending through said first slot; and

a second arm extending through said second slot.

7. The device of Claim 1, further comprising:

a guide rod positioned within said tubular body adjacent said wall of said tubular body, said disk member being slidably attached to said guide rod.

8. The device of Claim 7, said guide rod having a plurality of fixing elements, said plurality of fixing elements being suitable for retaining said disk member at a desired position within said tubular body.

9. The device of Claim 8, said guide rod extending for less than an entire length of said tubular body.

10. The device of Claim 7, further comprising:

fixing means positioned interior of said tubular body, said fixing means for setting a position of said disk member within said tubular body along a length of said tubular body.

11. The device of Claim 1, further comprising:

a spring hook affixed to an exterior surface of said tubular body.

12. A device for dispensing sandwiches comprising:

a tubular body having a slot extending longitudinally and through a wall of said tubular body;

a disk member positioned interior of said tubular body, said disk member having an arm extending outwardly therefrom, said arm extending outwardly of said tubular body through said slot; and

a fixing means positioned interior of said tubular body, said fixing means for setting a position of said disk member within said tubular body along a length of said tubular body.

13. The device of Claim 12, said fixing means comprising:

a guide rod having a ratcheted surface, said disk member having a hole through which said guide rod extends.

14. The device of Claim 12, said tubular body having an oval cross-section, said wall of said tubular body being flexible.

15. The device of Claim 12, said tubular body having a closed end and an open end, said disk member positioned adjacent said closed end.

16. The device of Claim 12, said disk member being a solid planar member extending transverse to a longitudinal axis of said tubular body.

17. The device of Claim 12, said slot comprising:

a first slot extending along and through said wall of said tubular body and a second slot extending along and through said wall of said tubular body on an opposite side of said tubular body from said first slot, said arm comprising a first arm extending through said first slot and a second arm extending through said second slot.

18. A device for dispensing sandwiches comprising:

a tubular body having a first slot extending longitudinally and through a wall of said tubular body and a second slot extending longitudinally and through a wall of said tubular body, said first slot being positioned on an opposite side of said tubular body from said second slot, said first and second slots extending for less than an entire length of said tubular body; and

a disk member positioned interior of said tubular body, said disk member having a first arm extending outwardly therefrom, said first arm extending outwardly of said tubular body through said first slot, said disk member having a second arm extending outwardly therefrom, said second arm extending outwardly of said tubular body through said second slot.

19. The device of Claim 18, further comprising:

fixing means positioned interior of said tubular body, said fixing means for setting a position of said disk member within said tubular body along a length of said tubular body.

20. The device of Claim 18, said tubular body having a closed end and an open end, said disk member positioned adjacent said closed end, said disk member being a solid planar member extending transverse to a longitudinal axis of said tubular body.
